

Replication data and procedures for:

Todd Allee and Clint Peinhardt “Delegating Differences: Bilateral Investment Treaties and Bargaining Over Dispute Resolution Provisions” *International Studies Quarterly*

This document: 1) describes the variables contained in the accompanying dataset, 2) lists the Stata commands used to estimate the primary ordered probit model (see Table 3) and predicted probability estimates (Table 4), and 3) presents the log printouts of the output generated from these commands.

1) Description of Variables in Dataset

country_1 – “home” country signatory

country_2 – “host” country signatory

cowcode1 – Correlates of War country code for home country

ifscore1 – International Financial Statistics country code for home country

cowcode2 – Correlates of War country code for host country

ifscore2 – International Financial Statistics country code for host country

bit_id – treaty identification number

date_signed – date (DD-MMM-YY) on which treaty was signed

year – year in which treaty was signed

icsid_clause – amount to delegation of dispute settlement authority to ICSID in treaty; 0 if ICSID is not mentioned in the treaty, 1 if ICSID is mentioned as one of at least two options for international arbitration, and 2 meaning ICSID is identified as the only venue for international arbitration

permncx1 – percentage of world’s largest MNCs located in the home country; data taken from various issues of *Forbes* magazine (see fn. 13 in the text for more details)

law_and_order1 – International Country Risk Group measure of “law and order” for the home country, ranges from 1 to 6 (see fn. 15 in the text for additional details)

law_and_order2 – International Country Risk Group measure of “law and order” for the host country, ranges from 1 to 6 (see fn. 15 in the text for additional details)

durable2 – the durability of the host regime, defined as the number of consecutive years since a three-point change in the Polity score over a period of three years or less (see Marshall and Jaggers 2005)

polconiii_2 – Henisz’s “POLCONIII” measure of political constraints on the executive in the host country; see Henisz 2002

atopally – equals 1 if the home and host country share any type of alliance tie and 0 otherwise; taken from the ATOP project (Leeds et al. 2002)

colony_any – equals 1 if the home and host country share any type of colonial tie and 0 otherwise (see fn. 18 in the text for additional details); taken from the ICOW colonial history data set, version 0.4

gdppc_grow2 – GDP growth in host country from last year to the current year; taken from World Development Indicators (WDI)

ibrdida_gdp2 – Host country IBRD loans and IDA credits as a % of Host country GDP (in current US\$); taken from World Development Indicators

exp_gdp2 – Host country exports of goods and services as a % of GDP; taken from World Development Indicators

right_gov2 – equals 1 if the host country is governed by a right-wing executive and 0 otherwise; taken from the Database of Political Institutions’ EXECRLC variable

cowstartten2 – equals 1 if the host country achieved independence within the past 10 years and 0 otherwise; dates of independence are taken from the Correlates of War State System Membership List

gdpball – the relative balance of home and host country GDP, calculated as home country GDP divided by the sum of home and host country GDP (all in current US\$); data taken from World Development Indicators

2) Stata Commands

a) Ordered Probit Model of ICSID Delegation (Table 3)

oprobit icsid_clause permncx1 law_and_order1 law_and_order2 durable2 polconiii_2 atopally colony_any gdppc_grow2 ibrdida_gdp2 exp_gdp2 right_gov2 cowstartten2 gdpbal1, robust

b) Predicted Probability Estimates (Table 4)

Note: One must have downloaded SPOST (Long and Freese 2005) to run the commands below in Stata. SPOST is available at: http://www.indiana.edu/~jslsoc/web_spost/sp_install.htm
